Apple Recruiting Team
Apple Inc.
Cupertino, CA

Dear Apple Hiring Team,

I'm writing to express my interest in a **Software Engineering position at Apple**. I've spent the past few years building **cloud-native services, streaming data pipelines**, and **infrastructure dashboards**, and I've loved every minute of it. Working with **Java, Spring Boot, Kafka**, and **GCP** feels second nature by now, and I'm excited by the idea of bringing that experience to a company known for solving problems at a whole different level.

At **TCS**, I built over **10 production-grade microservices** using **Spring Boot and Vert.x**. These supported **telecom workloads for more than 5 million users**. Later at **PSE&G**, I **automated CI/CD security scans** across cloud environments and created live dashboards that **cut incident resolution times by 30 percent**. There's something satisfying about watching systems run smoother because of work you've done behind the scenes.

Outside of work, I've led side projects like a **mobile app that autofills FDA MedWatch forms** (because public health reporting shouldn't feel like doing taxes) and a **Kafka-powered monitoring system** that turned system chaos into clarity. I build because I genuinely enjoy solving real-world problems with thoughtful code and, honestly, it's just fun to make things work beautifully under pressure.

I'm wrapping up my **M.S. in Computer Science at NJIT** with a **3.85 GPA** and looking forward to bringing my **energy, curiosity**, and **clean commit** history to Apple. If you're looking for someone who enjoys debugging gnarly issues, improving system reliability, and adding a little personality to team standups, I'd love to connect.

Thank you for considering my application. I'm excited about the possibility of joining a team where engineering excellence and meaningful impact go hand in hand.

Warm regards,
Kartikey Patel
